

Write the shell script to perform the following:

1. Use the commands **pr**, **sort**, and **cut** to read a text file in reverse order.

Input	Output
====	=====
File.txt	Ten
	Three
One	Two
Two	One
Three	
Ten	

2. Create a shell script to traverse through a filesystem tree. The script will start from the root file system "/" and traverse each subdirectory and list the contents of the directories similar to DFS/BFS.
3. Write a shell script that automatically starts httpperf (<https://github.com/httpperf/httpperf>) and Wireshark. Perform packet capturing when httpperf is running (preferably after 5 minutes). Make sure that the packet capturing and load generation happens only through the shell script.
4. Automate the Assignment#4(b) (LeNet5 architecture) using shell scripting.
